

“When you can see one less opportunity to stick your child and lessen their fears... it’s amazing.”

-Kelli B.

Eleven-year-old Jack has been in and out of the hospital since birth. Thousands of blood draws have left him traumatized. His moms says “the needles are scary enough, but Jack has difficult veins making every stick a challenge.” She heartbreakingly has tallied the poke marks after a collection, and sometimes even asks for a 30-minute break between attempts to calm Jack down before they try again. And, continuous heel sticks for glucose testing have left Jack’s feet so sensitive that he associates any attempt with pain.

44% OF pediatric blood draws **FAIL ON FIRST ATTEMPT**

24 50% of all blood draws occur BETWEEN 3AM-9AM disrupting valuable PATIENT TIME FOR HEALING

One in 5 people suffer from TRY PANOPHOBIA - a fear of needles

Compassionate technologies like PIVO™ make hospital stays a little less scary for Jack and his family.

Now an outspoken advocate for other patients, Jack’s mom believes this innovation is a game changer that can “save another child from ever having to overcome the pain and fear Jack has experienced” from blood collections.
